

## Questions for Interactive Video Conference 3/28/2006:

We've learned tons about salmon and river habitat, but we don't know exactly how the dams are going to be taken down and we are curious. How long will it all take? How is the difference between the two dams being considered in the take-down plans?

Will the sediment behind the Glines Dam really all wash out to sea?

Will Ediz Hook, the spit that creates Port Angeles harbor, become sandy again (which their teacher remembers : ) ?

What is the possible timeline of recovery? Will we be bringing our children, or grandchildren, to see salmon spawning up the Elwha?

Exactly how will the salmon return?

Will any native fish return, or will they all be planted fish? How exactly do stocked/planted fish find their way "home"?

How will the lands of the Lower Elwha tribe be protected through all this? Our speaker, Elaine Grinnell, didn't have time to really talk much about the spiritual tie between the river, salmon, and the Lower Elwha. Any more info about that aspect would be great.

What drew each of the video conference presenters to this project? Why are you passionate about it?
